Felicite Astodillo

John Greg Gonzales

John Bryan Gamboa

A. Group Context:

The group was working on the capstone entitled *"*ABLEWORK: A Web-Based Employment Assistance System for Matching Persons with Disabilities to Appropriate Work Opportunities*."*

During the implementation of the project, several actual problems were encountered. Task assignments were not always clearly followed, which caused delays in submission. Some members were unsure about their responsibilities, and updates were sometimes scattered across different conversations. In addition, files were not immediately organized, making it difficult to locate the latest versions of documents. Progress tracking was also affected because not all updates were reported on time.

To solve these problems, a digital workflow system was set up and used for three days. Specific tools were selected for communication, file sharing, document editing, and meetings. Through this setup, messages were centralized, files were organized in one location, and tasks were monitored more clearly. As a result, coordination among members was improved, and work was completed in a more structured manner.

B. System Setup

1. Communication Tool

Tool Used: Messenger (Group Chat)

Implementation:

- A group chat named "5i" was created and used by all members
- Task assignments and reminders were sent in the group chat
- Instructions for Chapter 1 and other requirements were given by the assigned leader
- Messages were used to confirm if tasks were completed
- Both fast replies and delayed responses were observed depending on internet availability

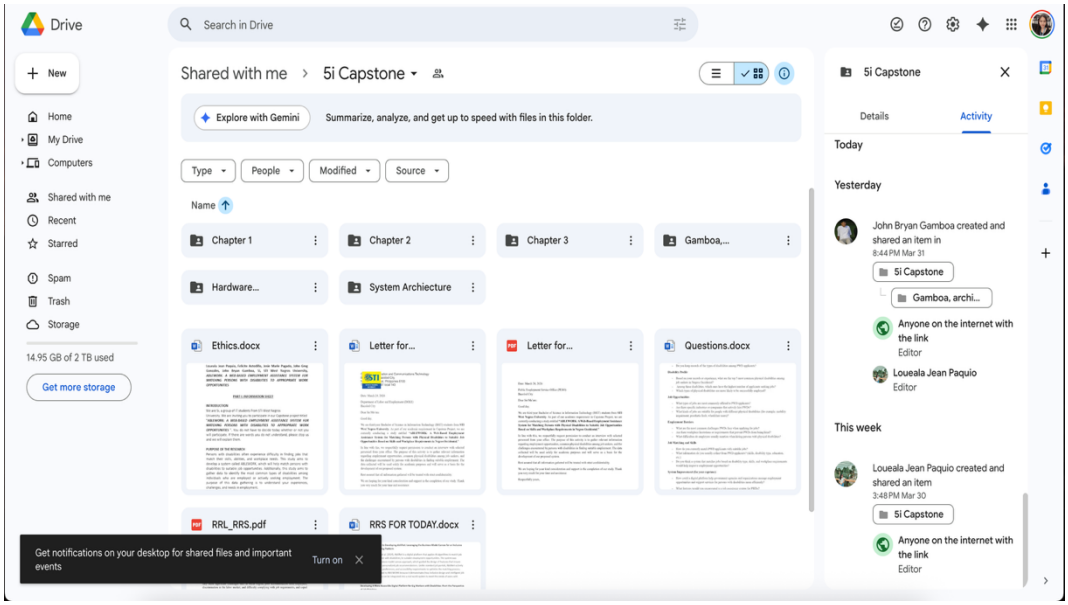
2. File Sharing Tool

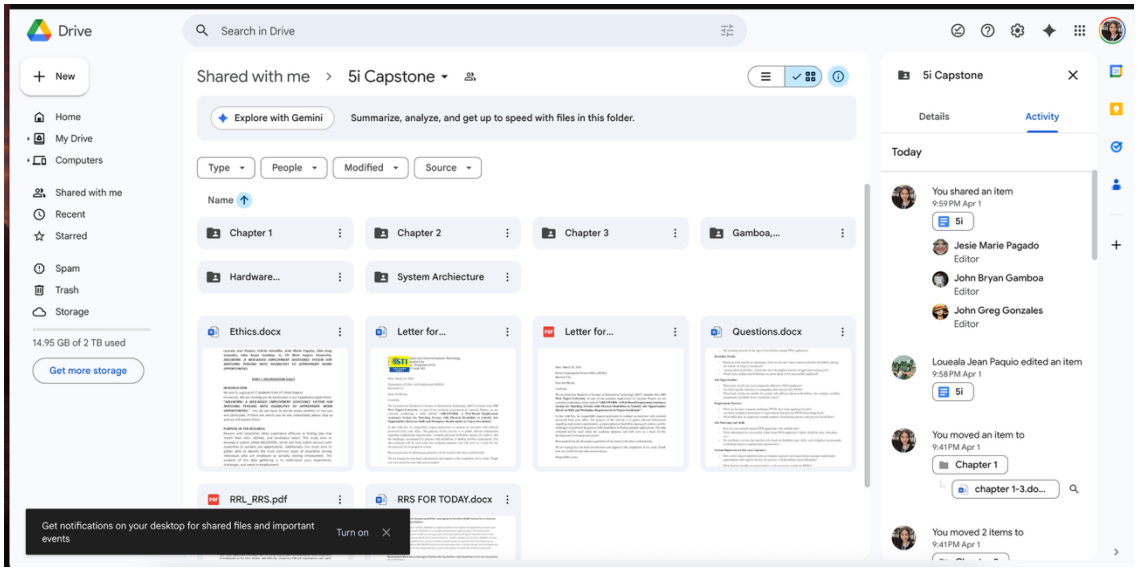
Tool Used: Google Drive

Implementation:

- A shared folder named “5i Capstone” was created
- Subfolders for Chapters 1–3 and Architectures were organized
- Members uploaded their outputs based on assigned tasks
- Files were stored in one location to avoid loss and confusion
- Updated versions of files were accessed by all members

Screenshots:





3. Office Automation Tool

Tool Used: Google Docs

Implementation:

- A shared document for Chapter 1 was created
- Each member was assigned a specific section
- Editing was done at the same time by different members

Screenshots:

4. Electronic Meeting

Tool Used: Discord

Implementation:

- One online meeting was conducted
- Project updates were presented
- Tasks were explained and clarified
- Questions were answered during the discussion

C. Actual Usage (3-Day Log)

Day	Activity	Tool Used
Day 1	Planning, task assignment, online meeting	Messenger, Discord
Day 2	File uploading and organizing	Google Drive
Day 3	Collaborative editing of Chapter 1	Google Docs

D. System Classification

Communication Type

- Synchronous communication:
  - Real-time meeting in Discord was conducted
  - Messages were sent and received instantly in Messenger
  - Simultaneous editing in Google Docs was performed
- Asynchronous:
  - Some replies in Messenger were delayed due to availability and internet issues

Electronic Conferencing

- **Multipoint communication** was observed since multiple members joined the meeting

End-User Computing (EUC) Tools

- Messenger - communication
- Google Docs - document editing
- Google Drive – file sharing
- Discord - meetings

Explanation:
These tools were used by the group to complete tasks without needing special skills. The basic features of each tool were used to help with communication, file sharing, and group work. Messages were sent in Messenger for updates and instructions. Files were uploaded and stored in Google Drive so they could be easily found. Documents were created and edited in Google Docs, and changes were checked by members. A meeting was done in Discord to discuss tasks and answer questions. Because of these tools, tasks were organized, progress was followed, and group work became easier.

E. Problems Encountered

1. Power Interruption
    - Some members were unable to upload files to Google Drive on the scheduled day due to power interruptions.
2. Internet Issues
    - Some members experienced lagging during Discord meeting.
    - Some messages were not replied to immediately
3. Minor Editing Conflicts
    - Some conflicts occurred when multiple members edited the same document simultaneously.
    - Some parts of the document were accidentally changed or removed during simultaneous editing

F. Improvements Based on Experience

- Task assignments should be clearly stated in the group chat
- Members should confirm their assigned work immediately
- Files should be properly organized in folders and uploaded on time to prevent delays
- Editing should be coordinated to prevent conflicts
- Meetings should be scheduled at a time when all members are available

G. Conclusion

The digital workflow system was used to manage the group's actual project tasks. Communication became more organized, and files were easier to access. Although some problems were experienced, such as internet issues and editing conflicts, the tasks were still completed. The use of simple tools helped the group improve coordination and complete the required outputs.
